Description

I have some HTML (,,, mainly) that has been submitted to my web application using CKEditor. I am building a PDF using the TFPDF library and this PDF contains various tables. Within one cell of a particular table I wish to insert the aforementioned HTML - how do i go about this?

Hi Joe,

The table cell does not "know" and interpret any html cells. What it does is just formats the specified tags with the specified formatting.

For example: will not break your line
ul and li will not create you an un-ordered list etc...

For any of these tags you could specify the text style.
See here:
http://tracker.interpid.eu/projects/pdf-addons/wiki/Fpdf-multicell-user-manual#Set-the-tag-styles

These are features that can be added to the class. I will add them to the "wish list".

There might be a solution for your paragraphs, see here:
http://tracker.interpid.eu/projects/pdf-addons/wiki/Fpdf-multicell-user-manual#Paragraphs

Regards, Andrei.
