Target version:	
Description I want to use <code><p></code> and <code></code> tags inside a table cell. I want them to behave like they do in HTML, i.e. be able to set padding and margins to the tags so that they space nicely, and allow <code></code> to have bullet points. Can you provide some examples?

Have a look in the `example-multicell-1-overview.php` example.

A paragraph example from there, generates the pdf(see screenshot).

Paragraph Example:~—Paragraph 1

~—Paragraph 2

~—Paragraph 2

Sample text~ - Paragraph 3

Sample text~~~ - Paragraph 1

~~~ - Paragraph 2

I would not try to replicate the `p/ul/li` functionality from html, as the tag based multicell works differently.
